ASL@brown.edu.

The lecture will be ASL interpreted and CART services will be provided. Friedman Auditorium is ADA accessible. If you require accommodations, please contact ASL@brown.edu by March 14, 2014.

The single greatest risk faced by Deaf people is inadequate exposure to a usable first language. Dr. Gulati will review recent research which validates the anatomical basis and time course of the critical period for first language acquisition, and which shows the risks to the development of empathic abilities among children who are language-deprived.

Hosted by the American Sign Language program at the Center for Language Studies and Program for Liberal Medical Education.
